## Contents

---

The Belgian account module defines the standard chart of account.

The module generates french and dutch chart of accounts / chart of taxes. The french / dutch XML files are generated from the same original XML file thanks to the localize.xsl XSLT script. The script will produce on the standard output the desired XML file. The XSLT script can be launched with the following command:

```
xsltproc --stringparam lang <lang> localize.xsl <xml file>
```

where lang is either fr or nl.
