1	Configuration	3
1.1	function	3
1.2	from	3
1.3	length	3
1.4	ttl	3
1.5	name	3

The **SMS** authentication module allows users to authenticate via SMS. It adds a new authentication method `sms`, which can be used in the list of `authentications` in the `session` section of the configuration file.

The `sms` method just sends a code via SMS to the user. Then the user needs to transcribe the code into the login dialog.

This method requires that the user has the correct *Mobile* phone number defined otherwise it will not be possible for them to authenticate.

CONFIGURATION

The configuration of the module is set in the `authentication_sms` section.

1.1 function

The fully qualified name of the method to send SMS. It must take three arguments: `text`, `to` and `from`. This method is required to send SMS.

1.2 from

The number from which the SMS are sent.

1.3 length

The length of the generated code. Default: 6

1.4 ttl

The time to live for the generated codes in seconds. Default: 300

1.5 name

The name used in the SMS text. Default: Tryton
