May 07, 2021

CONTENTS

- 1 Usage 3**
- 1.1 Activating cost prices per warehouse 3
- 1.2 Viewing product cost prices 3
- 1.3 Moving stock between warehouses 3

The *Product Cost Warehouse Module* allows the cost price of products to be calculated separately for each warehouse.

1.1 Activating cost prices per warehouse

In order to calculate and see [Product](#) cost prices per warehouse, the *Cost Price Warehouse* option must be checked in the [Product Configuration](#).

Any [Storage Locations](#) that are not under a [Warehouse](#) also need linking to a cost warehouse.

You must also ensure that the [Scheduled Task](#) that recalculates the cost prices is configured to run for each different warehouse.

Note: Once you have activated the cost prices per warehouse if you then want to deactivate it you may need to manually run a recalculation of all the products' cost prices.

1.2 Viewing product cost prices

With this module activated each [Product's](#) cost price is shown based on your current [Company](#) and [Warehouse](#). These can be updated in your user preferences.

1.3 Moving stock between warehouses

If you have checked the *Cost Price Warehouse* option, then to move stock between different [Warehouses](#) you must always use a transit [Location](#).
